

## Now is the Time

It's more important than ever to reduce your technology costs and complexity, simplify management of your environment, and reduce downtime. 3t Systems is here to help you make these goals a reality through the implementation of virtualization technologies. We work to understand your unique business so we can determine the right solution - not just the most expensive or most common solution. We partner with you to determine the right products and configurations that best fit each situation. Our virtualization solutions streamline the management of your IT infrastructure, enabling your staff to be more proactive and better utilize budget, through the use of:

### Desktop Virtualization

This technology allows your users to access their actual desktop from any computer at any time – removing the limitations of a traditional work environment. In addition, you can save significant time and resources previously used to spin up desktops and provide user support. We can deliver a complete desktop experience as an on-demand service delivered through the best method for your users - desktop, laptop, net book, smart phone or media tablet.

### Application Virtualization

This technology centralizes applications so your IT team can manage a single instance of each application in the datacenter and deliver them to users for use online or off-line. We can help you ensure the appropriate applications are delivered to your users on any device while saving time through a single point for administration.

### Server Virtualization

This technology enables you to leverage the hardware you have to run multiple virtual machines on each piece of hardware. In addition to realizing more efficient use of hardware, server virtualization can help you to reach your green IT initiatives, obtain substantial gains in administrative flexibility, and conduct better back-ups through the use of snapshots.

### Network Virtualization

This technology combines hardware and software resources and functionality into a single software-based administrative entity, which allows for your network to be virtualized and accessed locally or through the cloud. We deliver solutions that facilitate greater security, performance and portability of data resulting in substantial gains in efficiency within your corporate network, data center or private cloud.

### Storage Virtualization

This technology makes backing-up, archiving and recovery activities easier and quicker by simplifying the SAN. We can implement this solution to help you overcome common storage challenges, such as short backup windows, increasing data and tight budgets; while benefiting from continuous availability of critical data, better recovery options and alleviate tedious tasks for the storage administrator.
